

Protect you data with our copy protection COPRO5 / 7 / 8

Do you have sensitive data on your CD or DVD? Do you need to protect your digital properties from piracy? We do have perfect solutions for you and your customers!

COPRO5, 7 and 8, that's the ADIVAN solution. We have developed for you tools that will make you feel save. COPRO5 is a basic tool, low price and good enough to stop the "basic user" from copying your digital property. COPRO7 and 8 are more sophisticated and do function similar to the most common copy protection systems on the market. Any kind of copy protection can be "hacked". The good thing on COPRO is, that developed and distributed only by ADIVAN. Therefore there is no "hacker info" on the internet how to around our protection.

COPRO5 - our basic copy protection

COPRO5 protects perfectly from direct copies. So it is not possible to copy from CD to CD, or DVD to DVD and also from a copy tower. But it does not protect from copying CD/DVD to hard disc drive and back. All standard burning programs will interrupt the process as it finds non readable files on the disc. But if tried to copy to a hard disc drive, so the burning program will show a failure, saying "damaged and not readable files". But advanced computer users will know to succeed just giving directions to ignore and continue. Still this copy protection will keep at least 90% of all users away from "black copying".

COPRO7 and 8 – our advanced copy protection

COPRO7 protects like COPRO5 from direct copies but also protects additionally from copying on so called "copy-towers" plus copy CD/DVD to hard disc drive and back to CD/DVD. On the CD-Master there will be an additional dummy file. This file will be damaged during glasmastering process. There will be a check inserted in the start procedure of the data carrier, which will check out if the dummy file exists and still has same size and position. As it was damaged by intention it will never have the same size after it was copied. So COPRO7 is a very high level protection. COPRO8 has the same features but is not as secure as COPRO7 for the reason that on COPRO7 all control features are directly programmed into the CDs or DVDs applications. COPRO8 is made for applications and content where it won't be possible to insert any kind of files (e.g. Macromedia Flash and others). On COPRO 8 our files will not be inserted. Instead it will be added to the applications and therefore it is easier to "hack" it. Still, compared to the most protecting systems COPRO8 is a high level protection system. To mention, COPRO8 is save and programming can be fully done by ADIVAN. COPRO7 on the other side programming needs to be done by the customer.
